Project Title:

Autism Spectrum Disorder Using Machine Learning

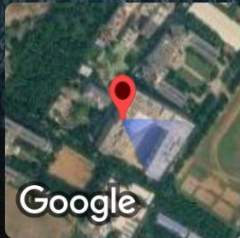

Presented by : Batch – 06

Location: VFSTR-Vadlamudi, Andhra Pradesh, India

The Inter Departmental Project (IDP) review was conducted to evaluate our practical knowledge, technical skills, and project progress, where we, the students of Batch-06, presented our project titled Autism Spectrum Disorder Prediction System in a professional environment before faculty evaluators; the main objective of our project is to develop an intelligent web-based platform that assists in the early detection of Autism Spectrum Disorder (ASD) in children using machine learning techniques by analyzing behavioral, social, and communication-related inputs provided by parents or caregivers and predicting the likelihood of ASD to support early intervention and medical consultation; our system integrates frontend and backend technologies, allowing users to interact through a responsive web interface by filling assessment forms while the backend processes the data using trained machine learning models and database systems to generate prediction results, and includes features such as user authentication, ASD screening questionnaire, prediction dashboard, result visualization, and basic recommendations based on outcomes; during the review, we explained the project concept, objectives, dataset usage, machine learning models, system architecture, and database design, demonstrated the working model, and each team member actively presented different modules including frontend, backend, model training, and result analysis while addressing questions on implementation and future enhancements, with evaluators reviewing our documentation, UI design, and methodology; this experience enhanced our knowledge in machine learning, data preprocessing, model evaluation, and full-stack development, while also improving communication, teamwork, and confidence, and the faculty appreciated the project's social impact while suggesting improvements such as increasing dataset size, improving accuracy, adding real-time doctor consultation, and enhancing UI; during development, we faced challenges like dataset collection and preprocessing, model selection, improving prediction accuracy, and integrating ML with the web application, which we overcame through research, experimentation, and teamwork; in the future, the project can be enhanced by incorporating deep learning, real-time behavioral analysis, multilingual support, mobile app integration, and connecting users with healthcare professionals, and overall, the IDP review was a successful and enriching experience for Batch-06, enabling us to showcase our work, gain constructive feedback, and improve our project, which has strong potential to contribute to early ASD detection and awareness.
